

## Environmental Policy

Glazing Vision operates in the construction industry manufacturing glass rooflights throughout the world. The main materials we use in manufacture of the products are extremely recyclable in that we use aluminium and glass. We have worked with the Anglia Ruskin University to develop an adopted system of assessing thermal performance of rooflights. Our aim is to have the most desirable rooflights on the marketplace both in terms of aesthetics and thermal performance.

Glazing Vision prides itself on full compliance to all relevant environmental legal and regulatory requirements, continued improvement, whether in product performance, service, energy efficiency, waste reduction, recycling and prevention of environmental incidents.

It is our objective to increase awareness of our staff, local community, suppliers and customers to our performance through monitoring waste and energy consumption and setting yearly goals to improve the company's environmental performance on the environment.
